

Factoring Review

Recall: Factoring is the opposite of expanding.

$$(3x + 1)(x - 4) = 3x^2 - 11x - 4$$

Method 1: Common Factoring

a. $4x^2 - 6x$ b. $2m^3 - 4m^2 - 16m$ c. $4ab^2 + 4a^2b - 5ab$

Method 2: Simple Trinomials

a. $x^2 + 5x - 6$ b. $m^2 - 3m - 28$ c. $x^2 - 5x + 6$

Method 3: Factoring by Grouping

a. $x^2 + x - xy - y$ b. $2x^2 + 4x + 6y + 3xy$ c. $5m^2t - 10m^2 + t^2 - 2t$

Method 4: Decomposition

a. $6x^2 + x - 12$ b. $4m^2 - 11m - 3$ c. $2a^2 + 13a + 15$
